

Backend

Simple Ads API

Create a simple Ads management API that shows ads and related tags/categories. It will be a part of a module handling the Advertiser functionalities towards these ads. Since advertiser will be assigned with an ad to start and should include the following:

Ads Attributes:

type(free/paid), title, description, category, tags, advertiser, start_date.

-Each Ad is created under one category and has many related tags

-One category can have many ads and each Ad is related to one category.

-schedule a daily email at 08:00 PM that will be sent to advertisers who have ads the next day as a reminder.

Endpoints should contains: -Tags (CRUD)

-Categories (CRUD)

-Ads filters (by tag, by category) -Showing Advertiser Ads

Notes:

-Use any recent version of laravel framework.

-It will not be necessary to do any Authentication, you can just seed the database with some advertiser to be linked with Ads.

-You should implement this project in clean code and always take care of scalability.

-Create a public github repository and push your project to it.
